

## Product Data Sheet: BAX

**Cat. No:** AB-10230

Conjugate: Unconjugated

Size: 200 ug
Clone: POLY

**Concentration:** 1mg/ml

Host: Rb Isotype: IgG

**Immunogen:** Synthetic peptide mapping to the amino terminal domain of human Bax

**Reactivity:** Hu, Ms, Rt

**Applications:** WB: 1:1000 IP: 1:200 IHC(P): 1:200

**Purification:** Aff. Pur

Bcl-2 family of proteins is a key regulator of apoptosis that function to either inhibit or promote cell death. The over expression of members such as Bcl-2 and Bcl-xL inhibit the apoptotic process (1,2). The Bcl-2 family members are also characterized by dimerizing to further modulate apoptosis. Bag-1, for example, has been found to form a heterodimer with Bcl-2 resulting in the enhancement of the anti-apoptotic effect of Bcl-2 (3,4). Other anti-apoptotic Bcl-2 family members include A1, Bcl-xg, Bcl-xb, Mcl-1, BAR, Bl-1 and Bcl-w (5). The pro-apoptotic family members include Bax, Bcl-xS,

**Background:** Bad, Bak, NBK, BID, Hrk, Bok, Bim, Noxa and Diva. Bax and Bak have been shown to

play a critical role in cytochrome c release from mitochondria and thus initiate apoptosis (6). Bad plays a critical role in the Bax-mediated apoptosis pathway by dimerizing with Bcl-xL, causing the displacment of Bax. The displacement of Bax allows apoptosis to proceed (7). Bcl-xS, a shorter version of Bcl-xL (lacking amino acids 126-188), apparently utilizes a different pathway than Bax to induce cell death. Some research suggests that Bcl-xS uses a novel mechanism for regulating caspase

or it may use an alternate cell death effector pathway (8,9).

Form: Liquid

**Buffer:** 20 mM Tris-HCl, pH 8.0

**Storage:** Store this product at 4° C, do not freeze.
