This gene encodes the alpha-1 chain of type II collagen, a fibrillar collagen found in cartilage and the vitreous humor of the eye. Mutations in this gene are associated with achondrogenesis, chondrodysplasia, early onset familial

osteoarthritis, SED congenita, Langer-Saldino achondrogenesis, Kniest dysplasia, Stickler syndrome type I, and spondyloepimetaphyseal dysplasia Strudwick type.

In addition, defects in processing chondrocalcin, a calcium binding protein that is

the C-propeptide of this collagen molecule, are also associated with

chondrodysplasia. There are two transcripts

identified for this gene.
