This gene encodes a member of the NOX-family of enzymes that functions as the

catalytic subunit the NADPH oxidase complex. The encoded protein is localized to

nonphagocytic cells where it acts as an oxygen sensor and catalyzes the

**Background:** reduction of molecular oxygen to various reactive oxygen species (ROS). The ROS

generated by this protein have been implicated in numerous biological functions

including signal transduction, cell differentiation and tumor cell growth. A

pseudogene has been identified on the other arm of chromosome 11. Alternative

splicing results in multiple transcript variants.
