

Product Data Sheet: Phospho-Met (Y1234/Y1235)

Cat. No: MAB-3305

Conjugate: Unconjugated

Size: 100 ug Clone: 3D7 **Concentration:** 1mg/ml Host: Rb

Reactivity: Hu, Ms, Rt

Isotype:

Background:

Applications: Western Blotting 1:1000

IqG

Molecular Weight:

Monoclonal antibody is produced by immunizing animals with a synthetic **Purification:**

phosphopeptide corresponding to residues surrounding Tyr1234/1235 of human

Met, a high affinity tyrosine kinase receptor for hepatocyte growth factor (HGF, also known as scatter factor) is a disulfide-linked heterodimer made of 45 kDa α and 145 kDa β -subunits (1,2). The α -subunit and the amino-terminal region of the β -subunit form the extracellular domain. The remainder of the β -chain spans the plasma membrane and contains a cytoplasmic region with tyrosine kinase activity. Interaction of Met with HGF results in autophosphorylation at multiple tyrosines, which recruit several downstream signaling components, including Gab1, c-Cbl, and PI3 kinase (3). These fundamental events are important for all of

the biological functions involving Met kinase activity. The addition of a phosphate at cytoplasmic Tyr1003 is essential for Met protein ubiquitination and degradation (4). Phosphorylation at Tyr1234/1235 in the Met kinase domain is critical for

kinase activation. Phosphorylation at Tyr1349 in the Met cytoplasmic domain provides a direct binding site for Gab1 (5). Altered Met levels and/or tyrosine kinase activities are found in several types of tumors, including renal, colon, and breast. Thus, Met is an attractive cancer therapeutic and diagnostic target (6,7). Phospho-Met (Tyr1234/1235) (3D7) Rabbit mAb detects endogenous levels of Met only when phosphorylated at tyrosine 1234/1235. This antibody may cross-

react with activated Ron and FGF receptors.

Form: liquid

Buffer: PBS with 0.02% sodium azide, 50% glycerol, pH7.3.

Storage: Store at -20°C, and avoid repeat freeze-thaw cycles.

For Research use only **IMMUNOLOGICAL SCIENCES**
