Nuclear factor of kappa light polypeptide gene enhancer in B-cells 3

NF-kappa-B is a ubiquitous transcription factor involved in several biological processes. It is held in the cytoplasm in an inactive state by specific inhibitors. Upon degradation of the inhibitor, NF-kappa-B moves to the nucleus and activates

Background: transcription of specific genes. NF-kappa-B is composed of NFKB1 or NFKB2

bound to either REL, RELA, or RELB. The most abundant form of NF-kappa-B is NFKB1 complexed with the product of this gene, RELA. Four transcript variants

encoding different isoforms have been found for this gene.
