| <b>Background:</b>    | <p>This gene encodes a globin protein found in vertebrate cells. The encoded protein is described as a hexacoordinate hemoglobin which binds ligand differently from the pentacoordinate hemoglobins involved in oxygen transport, and may be involved in protection during oxidative stress. This gene is located on chromosome 17 in the same region as a retinal gene which is mutated in progressive rod-cone degeneration, but in the opposite orientation. [provided by RefSeq, Jan 2012], function: May have a protective function during conditions of oxidative stress. May be involved in intracellular oxygen storage or transfer., similarity: Belongs to the globin family., subunit: Homodimer; disulfide-linked., tissue specificity: Ubiquitously expressed. Highest expression in heart, stomach, bladder and small intestine.,</p> |
