Background:	D-dopachrome tautomerase converts D-dopachrome into 5,6-dihydroxyindole. The DDT gene is related to the migration inhibitory factor (MIF) in terms of sequence, enzyme activity, and gene structure. DDT and MIF are closely linked on chromosome 22. [provided by RefSeq, Jul 2008], catalytic activity: D-dopachrome = 5,6-dihydroxyindole + CO(2)., function: Tautomerization of D-dopachrome with decarboxylation to give 5,6-dihydroxyindole (DHI)., similarity: Belongs to the MIF family., subunit: Homotrimer.,
