Background:	Cell surface heparan sulfate proteoglycans are composed of a membrane-associated protein core substituted with a variable number of heparan sulfate chains. Members of the glypican-related integral membrane proteoglycan family (GRIPS) contain a core protein anchored to the cytoplasmic membrane via a glycosyl phosphatidylinositol linkage. These proteins may play a role in the control of cell division and growth regulation. [provided by RefSeq, Jul 2008], function: Cell surface proteoglycan that bears heparan sulfate., similarity: Belongs to the glypican family., tissue specificity: In adult, primarily expressed in the brain. Also detected in fetal brain, lung and liver.,
