Background:	This gene belongs to the neuron navigator family and is expressed predominantly in the nervous system. The encoded protein contains coiled-coil domains and a conserved AAA domain characteristic for ATPases associated with a variety of cellular activities. This gene is similar to unc-53, a <i>Caenorhabditis elegans</i> gene involved in axon guidance. The exact function of this gene is not known, but it is thought to play a role in neuronal development and regeneration. Alternative splicing results in multiple transcript variants. [provided by RefSeq, Nov 2009],developmental stage:Expressed in fetal brain and heart.,function:May be involved in neuronal migration.,similarity:Belongs to the Nav/unc-53 family.,subcellular location:Associates with a subset of microtubule plus ends. Enriched in neuronal growth cones.,subunit:Interacts with tubulin.,tissue specificity:Broadly expressed at low levels. Expressed at high levels in heart, skeletal muscle and placenta.,
